Introduction

The `System` category's events occur during system updates or backups.

upcp

This event takes place when cPanel & WHM updates.

Available Stages:

- `pre` — Hook action code runs before the update process.

Important

Unlike other `pre` stages, the success or failure of this event's hook action code **cannot** block execution of the cPanel & WHM event. The Standardized Hooks System **cannot** affect the cPanel & WHM update process.

- `post` — Hook action code runs after the update process.

Standardized Hooks

Action Code Runs As:	root
Blocking Attribute:	
Escalate Privileges Attribute:	N/A

Output parameters

This event does not return output.

Backup

This event takes place when the system performs backups.

Available Stages:

- `pre` — Hook action code runs before the system performs backups.
- `post` — Hook action code runs after the system performs backups.

Note:
Hooks for this event do **not** trigger when the *Legacy Backup System* runs.

```
Action Code Runs As: root
Blocking Attribute: 
Escalate Privileges Attribute: N/A
```

Output parameters

This event does not return output.

You can select the following options:

-
