

Remote Access Key

This document is for a previous release of cPanel & WHM. To view our latest documentation, visit our [Home page](#).

For cPanel & WHM 11.44

([Home](#) >> [Clusters](#) >> [Remote Access Key](#))

[Overview](#)
[Generate a new access key](#)
[Access Key Signature](#)

Overview

You can use this feature to generate an access key, which is also known as an access hash. You can use this access key for automatic account creation scripts, external billing software, and to allow servers in your DNS or configuration clusters to exchange records.

Generate a new access key

To generate a new access key, perform the following steps:

1. Click *Generate New Key*.
2. Copy and paste the new access key to the appropriate file on the remote server(s) that need to communicate with your web server.
 - To configure a DNS server cluster, read our [DNS Cluster](#) documentation.
 - To configure a configuration cluster, read our [Configuration Cluster](#) documentation.

Note

You can view the access hash via the command line in the `/root/.accesshash` file.

Access Key Signature

The *Access Key Signature* includes the first 32 characters of the remote access key, separated by colons (:).

You can use this signature to quickly check whether you have used the correct access key in interfaces that display the key in a shortened format.
