

WHM Home Interface

For cPanel & WHM version 58

Overview

The WHM *Home* interface includes links to all of WHM's sections. You can use WHM's interfaces to manage IP addresses, accounts, and software on your server.

WHM interface sections

Section name	Function
Server Configuration	The <i>Initial Setup Wizard</i> interface, which the server ran when you first accessed WHM, aided you to properly configure your server. You can use the <i>Server Configuration</i> section to update these configuration options.
Support	This section allows you to determine how your customers contact you for support, and provides cPanel & WHM support for you.
Networking Setup	This section allows you to configure your server for use on the Internet.
Security Center	This section allows you to improve security on your server. For example, you can fix insecurities in suEXEC or CGI, or manage SSH keys and users.
Server Contacts	This section allows you to choose how to contact the server's administrator.
Resellers	This section allows you to access a list of your reseller accounts, as well as the <i>Reseller Center</i> interface, in which you can assign new reseller accounts and configure existing reseller accounts.
Service Configuration	This section allows you to configure cPanel & WHM's services and service daemons.
Locales	This section allows you to manage your server's locales.
Backup	<p>This section allows you to create backups of your server's configuration and content, and schedule automatic backups. You can use backups at a later time to restore data on your server.</p> <div style="border: 1px solid red; padding: 5px;"><p>Warning: It is very important to create backup files of all of the information on the server. When you or other users delete files, there is no other method to recover them.</p></div>
Clusters	This section allows you to configure a number of servers to share DNS information or WHM configuration settings, and to create a trust key relationship between those servers.
System Reboot	This section offers two methods to reboot your server. The method that you should use depends on why you wish to reboot the server.
Server Status	This section allows you to access several lists to view information about your server. These lists are helpful when you troubleshoot hardware or software issues.
Account Information	This section allows you to view information about specific accounts, your accounts in general, and provides a number of configuration options.

Account Functions	This section allows you to create new WHM or cPanel accounts, and to manage the existing accounts on your server.
Multi Account Functions	This section allows you to manage multiple cPanel accounts at one time.
Transfers	This section allows you to copy accounts from one server to another.
Themes	<p>This section allows you to manage cPanel themes. A cPanel theme is the skeletal frame on which the interface's visual style, or skin, appears.</p> <div style="border: 1px solid #f0e68c; padding: 10px; margin-top: 10px;"> <p>Note: We do not currently support custom theme or localization efforts for WHM.</p> </div>
Packages	Packages are limitations on the resources that you allow an account to use. For example, you may specify how much disk space an account can use. The system bundles and saves these limitations so that you can apply them to accounts later. This streamlines the creation of new accounts, because it allows you to sell predefined packages to your cPanel account holders or resellers.
DNS Functions	This section provides access to basic functions that relate to your server's Domain Name System (DNS) data.
SQL Services	This section allows you to manage SQL databases on your server.
IP Functions	This section allows you to manage IP addresses on your server.
Software	This section allows you to manage software that you installed on your server.
Email	This section allows you to configure and manage how your server handles email.
System Health	This section allows you to view data about your server's usage, as well as processes that run on the server.
cPanel	This section allows you to manage features that directly relate to your cPanel customers.
SSL/TLS	SSL and TLS are cryptographic schemes that allow a visitor's web browser to communicate securely with a web server. You should use SSL/TLS to protect all of the sensitive data (for example, credit card numbers, or login information) that your server transmits over the Internet. TLS is the most recent version of SSL. This section allows you to perform several functions to help secure your server.
Market	This section allows you to manage the providers that will appear in each user's cPanel Market. It also allows you to manage the products that appear, their prices, and which one to recommend.
Restart Services	This section allows you to restart a service (usually a daemon) on your web server. Daemons are small processes that run in the background of your server.
Development	This section allows easy access to development resources, which include an interface to manage Standardized Hooks .
Plugins	This section allows you to configure the plugins on your server.
