[Additional documentation](#)

Overview

The Calendar and Contacts Server (CCS) allows your cPanel users to manage their CalDAV (calendar) and CardDAV (contacts) accounts from your cPanel & WHM server.

When you install this plugin, CCS becomes the main calendar and contacts tool. Your server keeps the information available in Horde. However, cPanel account and Webmail users will no longer be able to connect to the Horde calendar or address book.

Important:

The CCS plugin is compatible CentOS 7, CloudLinux 7, and Red Hat® Enterprise Linux® 7. The plugin is **not** compatible with CentOS 6, CloudLinux 6, Red Hat® Enterprise Linux® 6, and Amazon Linux.

Install the plugin

To install the CCS plugin:

1. Navigate to WHM's [Manage Plugins](#) interface (*WHM >> Home >> cPanel >> Manage Plugins*).
2. Click *Install "Calendar and Contacts Server"*. A success message will appear when the installation process completes.

Your cPanel users can now connect CCS to Roundcube, Horde, or other applications. For more information, read our [How to Set Up Calendars and Contacts](#) documentation. Enter port 8443 when you set up the server name and port.

Note:

As a system administrator, you can **only** access CCS data through the calendar port (8443). You can manage CCS data through Horde, Roundcube, or other applications.

Uninstall the plugin

To uninstall the CCS plugin:

1. Navigate to WHM's [Manage Plugins](#) interface (*WHM >> Home >> cPanel >> Manage Plugins*).
2. Click *Uninstall "Calendar and Contacts Server"*. A success message will appear when the uninstallation process completes.

Warning:

The system erases **all** CCS data when you uninstall the CCS plugin.
