

# Reseller Modifications

For cPanel & WHM version 58

This set of features allows you to modify the way your resellers interact with your web server.

## Important

Before you use any of these features, remember to select the reseller account you would like to modify from the *Select a Reseller* menu. You can select any reseller who can access his or her account via WHM.

- [Edit Reseller Nameservers and Privileges](#)— This interface offers a number of configuration options for your reseller accounts. You are free to limit a reseller's ability to create accounts and access various features. You may also confer root access, assign nameserver IP addresses for accounts created by the reseller, and add A entries for those addresses.
- [Change Ownership of Multiple Accounts](#) — This feature allows you to change the ownership of many domains at once.
- [View Reseller Usage and Manage Account Status](#) — These features allow you to keep track of your resellers' disk space and bandwidth usage. You can also use this set of features to suspend, unsuspend, and terminate reseller accounts.
- [Manage Reseller's IP Delegation](#) — Use this feature to deny resellers the use of certain IP addresses, or allow a reseller account to use any available IP.
- [Manage Reseller's Shared IP](#) — This feature allows you to specify an IP address that resellers will use when they set up shared or "IPless" accounts.
