Overview

If the package that you select contains package extensions, you will see the *Package Extensions* section.

Important:

You **cannot** add or remove package extensions when you create an account in the WHM interface. To use a different set of package extensions, you **must** use one of the following methods:

- Add a new package with the desired extensions in the *Add a Package* interface (WHM >> Home >> Packages >> Add a Package).
- Use API calls to modify the package extension data for an existing package. For more information, read our [Guide to Package Extensions](#) documentation.

Select package extension options

To view package extensions, you must select an existing package from the *Choose a Package* menu. You can then select the *Select Options Manually* checkbox to modify the settings for the associated package extensions. Any options or settings that you can edit will appear below each extension's name.

Note:

To find out more about your extension's options, consult the third-party software's documentation.
